

Airbnb Melbourne Market Analysis : Business Analytics Project Brief

Background

Airbnb is an online marketplace connecting hosts with guests seeking short- and long-term accommodation worldwide. Property owners can list homes on the platform to generate additional income. Before listing, however, a prospective host should understand the local market, including demand, supply, competition, and pricing, to make informed decisions.

You have been engaged by a client who intends to list multiple properties on Airbnb in Melbourne. Your task is to act as their business analytics consultant.

The Data

The dataset is sourced from [Inside Airbnb](#), an independent project that publishes publicly available Airbnb listing data to support analysis of the short-term rental market. The Melbourne dataset is a snapshot collected on 16 June 2026 and covers active listings across Greater Melbourne and surrounding local government areas.

It consists of three files:

1. **listings_airbnb.csv** : detailed information on every active listing (~90 variables), including property attributes, host details, location, pricing, and review scores.
2. **reviews_airbnb.csv** : all guest reviews, including reviewer information and free-text comments.
3. **calendar_airbnb.csv** : daily availability and price data for each listing over the next 365 days.

Most variables are self-explanatory; for detailed definitions, consult the [Inside Airbnb data dictionary](#).

(<https://docs.google.com/spreadsheets/d/1iWCNJcSutYqpULSQHINyGInUvHg2BoUGoNRI Ga6Szc4/edit>)

Please note that this is real-world data collected from Airbnb.com. As a result, the dataset may be messy and contain issues such as incomplete or missing values, extreme values, and a large volume of data.

Your Task

Explore the dataset and assess the information it captures. Then, define a business problem or opportunity that can be addressed using this dataset, and develop a comprehensive business analytics project to solve it. For example, you may investigate questions such as: *What drives nightly price variation across Melbourne Airbnb listings?* or *What factors distinguish Superhosts from regular hosts?*

When defining your business problem, ensure that it is clearly focused, can be answered using the available data, and provides insights that support decision-making and problem-solving.
